PAN India EXIM Trade Distribution

Distribution of EXIM containers for AMJ 2024 quarter across all ports:

Import Containers Distribution (51.2%)
(Container count in % for AMJ'24)

Export Containers Distribution (48.8%)
(Container count in % for AMJ'24)

In the previous quarter, container distribution in import and export cycle was 48.2% and 51.8% respectively.

Others include Kandla, Haldia, Paradip and New Mangalore

Key Observations- AMJ'24 Quarter

In comparison with JFM 2024:

Pan India

- Container volume has **increased by 3% in** import cycle. This increase is largely due to the 3.5% & 2.1% increase in import container volume of western region & southern region ports respectively
- Pan India dwell time performance has **reduced by 14%** in import cycle. This decline is largely due to reduction of 21% & 20% in import dwell time performance of western region & eastern region ports respectively
- Top performing terminal for this quarter is Gateway Terminals India (JNPA port)

Western Region

- Container volume has **increased by 3.5% in** import cycle
- Container volume has **reduced by 11%** in export cycle. This decline is largely due to the reduction of export cycle containers at JNPA by 25% from the previous quarter.
- Mundra port dwell time performance has **reduced by 29%** in import cycle. The primary reasons include nearby CFS experiencing space issues due to an increase in container traffic and construction projects of rail line expansion & additional terminals, which has caused the delay in clearance
- JNPA port dwell time performance of rail-bound containers has **reduced by 22%** in import cycle. The primary cause is the increase in the pendency of containers due to lack of rail racks.
- Kandla port dwell time performance has **reduced by 30%** in import cycle as the port majorly handles coastal containers.

Southern Region

- Southern region dwell time performance has **improved by 4%** in import cycle. This is majorly due to improvement in the performance of Tuticorin port
- Tuticorin port dwell time performance has **improved by 20%** in import cycle as import container volume has reduced, leading to a decrease in container clearance time

Eastern Region

- Haldia port dwell time performance has **improved by 3%** in export cycle as export container volume has reduced, leading to a decrease in container clearance time
- Visakhapatnam port dwell time performance has **reduced by 21%** in import cycle due to construction work by NHAI outside the port gate in the previous quarter which led to delays in the port operations
- Haldia Port to CFS transit time has **increased by 107%** due to change in traffic guidelines because of assembly election campaign

05 CONGESTION & TRANSIT ANALYSIS

Congestion Analysis & Methodology

The analysis aims to understand the level of traffic around ports and CFS region to measure the congestion level on the route:

Methodology

Step 1 CFSs are divided into clusters based on their vicinity

Step 2 Cluster based transit time is calculated. The transit time is the travel time between CFS clusters and port or vice versa.

Step 3 Cluster based congestion level is calculated as per below steps:

1. Cluster based transit time is compared with threshold
2. Threshold is 3X of time showcased on Google Maps between the Origin-Destination (OD) pair
3. Intensity of congestion is classified as below:
 - High congestion: >2 times the threshold
 - Medium congestion: >1.5 to ≤ 2 times the threshold
 - Low congestion: >1 to ≤ 1.5 times the threshold
